

FUNCTIONAL ASL: PERFUSION BASED FUNCTIONAL MRI USING ARTERIAL
SPIN LABELING

APPLICATIONS OF ASL IN NEUROSCIENCE

Luis Hernandez-Garcia, Ph.D.

Functional MRI laboratory

University of Michigan

FUNCTIONAL MRI LABORATORY
UNIVERSITY OF MICHIGAN

OVERVIEW

- Quick review of ASL
- The niche for ASL
- Examples of practical applications in literature

A generic ASL pulse sequence

Some Options

- Pulsed vs. Continuous
- Delays
- Saturation Pulses
- 2D, 3D ...

CONTINUOUS ASL

PULSED ASL SCHEMES

VELOCITY SELECTIVE ASL

ASL-BASED FUNCTIONAL MRI

Raw (unsubtracted) time course

A LINEAR MODEL FOR ASL

Base image

BOLD effects

ASL at rest

ASL during activation

QUANTIFYING *DYNAMIC* PERFUSION CHANGES

Traditional Approach:

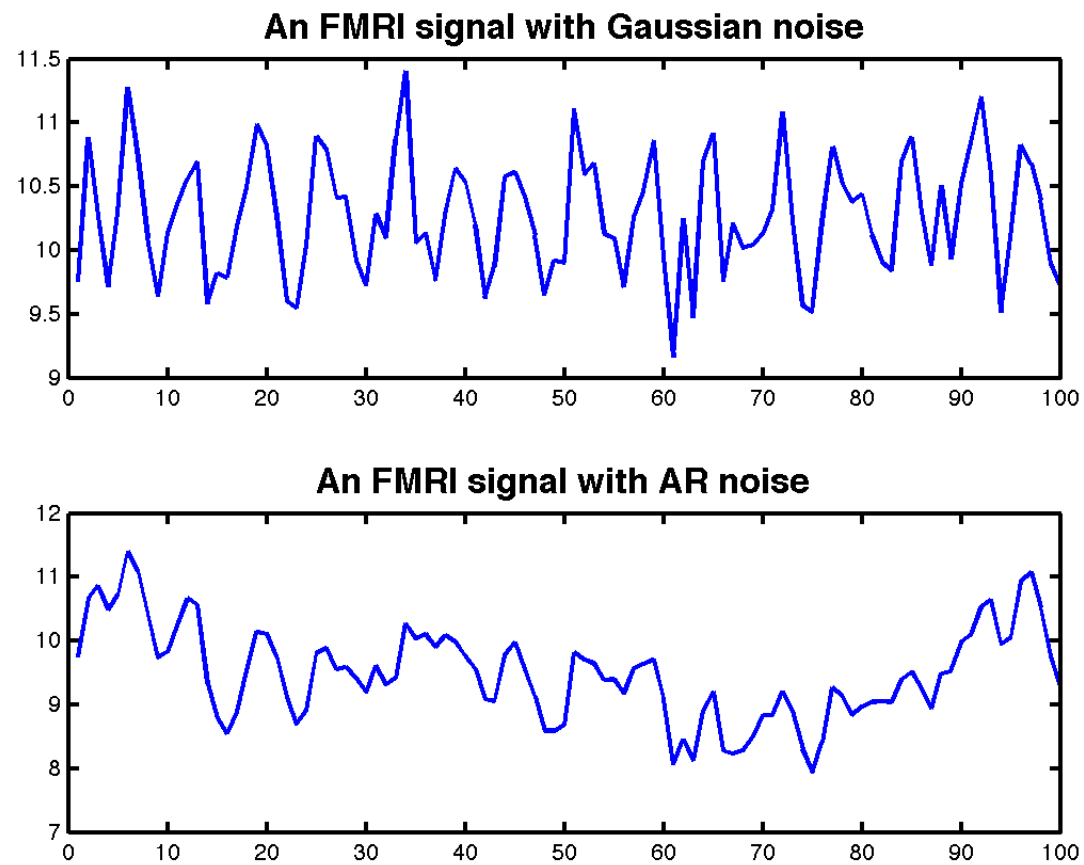

1. Calculate perfusion from each subtraction pair using tracer kinetics Wang J, et al. (2002). *Magn. Reson. Med.*, vol. 48, no. 2, pp. 242-254.
2. Calculate difference in perfusion between conditions.
3. Calculate means and variances

GLM Approach:

1. Translate GLM parameters (betas) into perfusion.
2. Translate variance estimates (sigmas) into perfusion effects variance

Hernandez-Garcia L, et al. (2010), *Magn. Res. Imaging*, 28 (7), Pages 919-927.

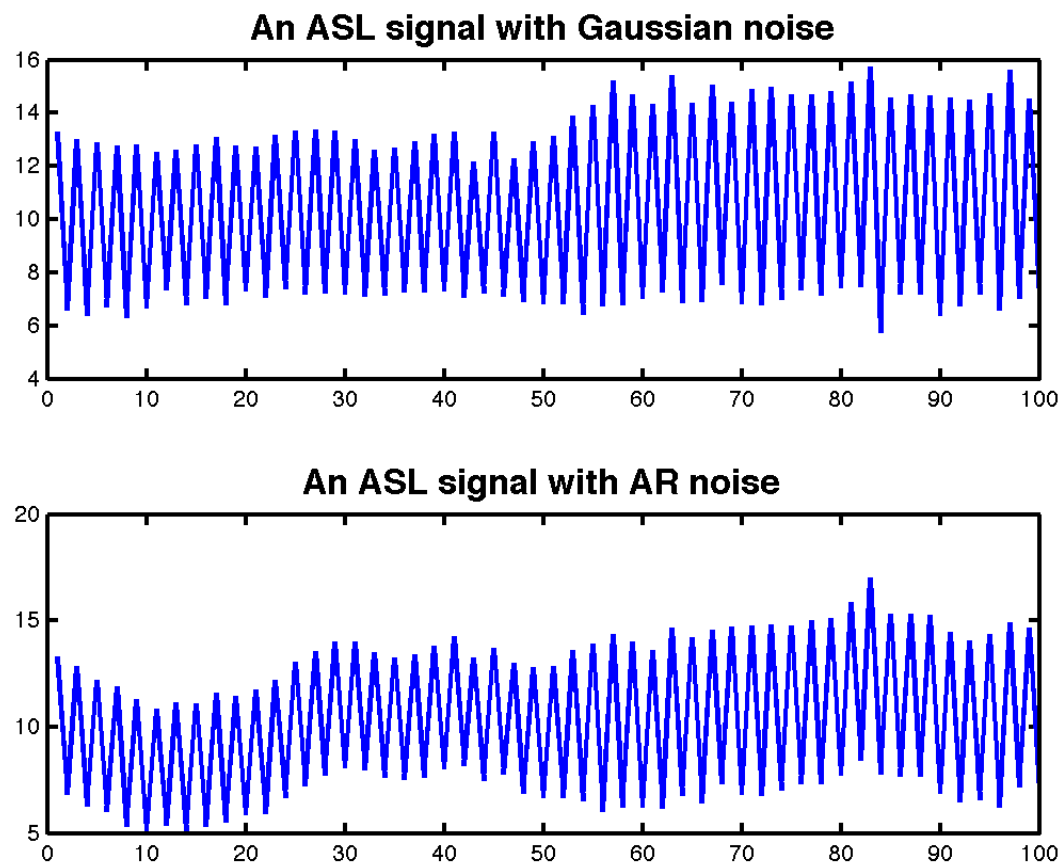

EVENT RELATED BOLD

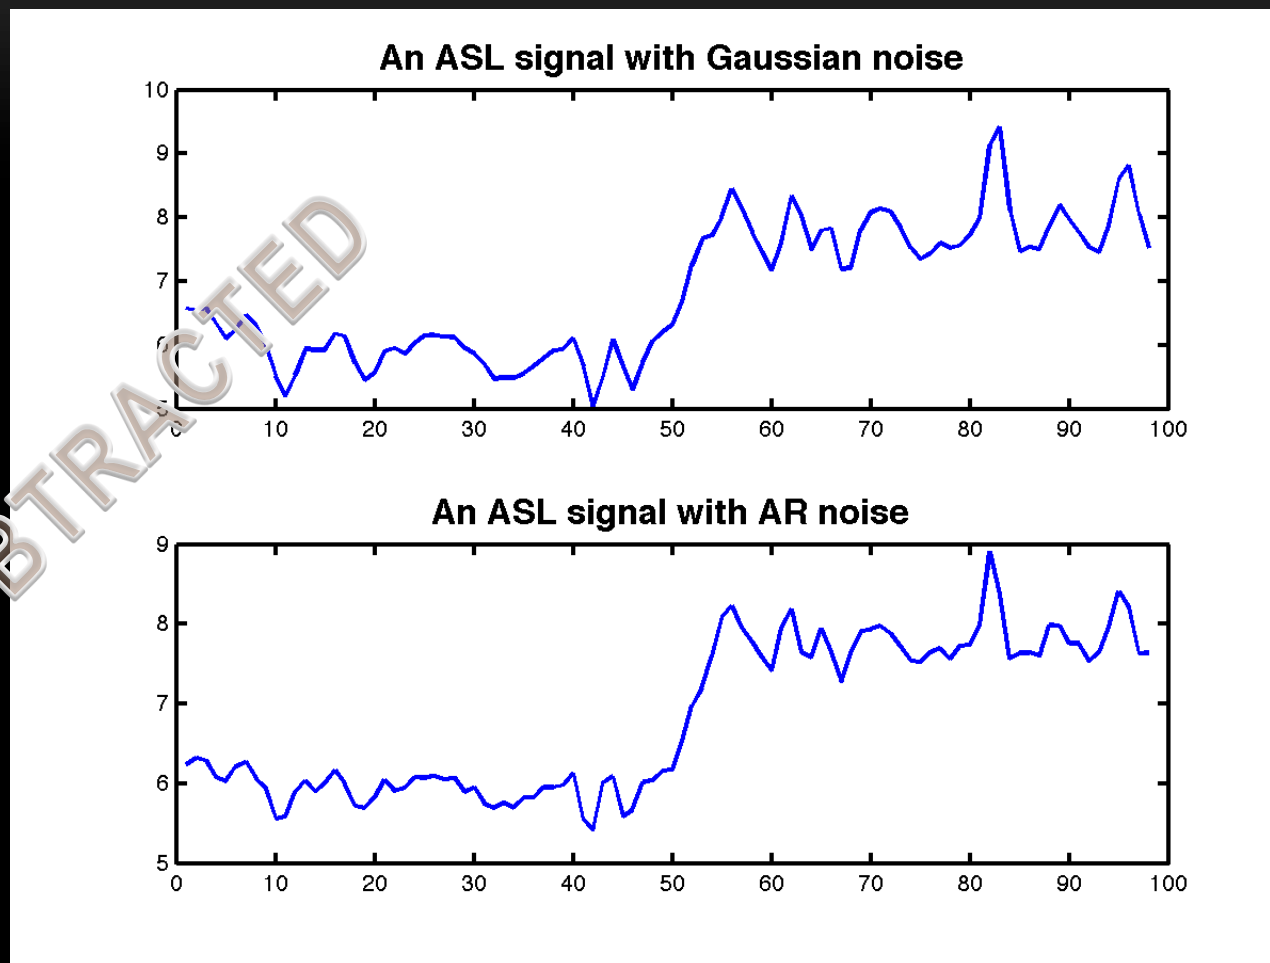

BLOCKED DESIGN BOLD: SLOW PARADIGM

BLOCKED DESIGN FASL: SLOW PARADIGM

BLOCKED DESIGN FASL: SLOW PARADIGM

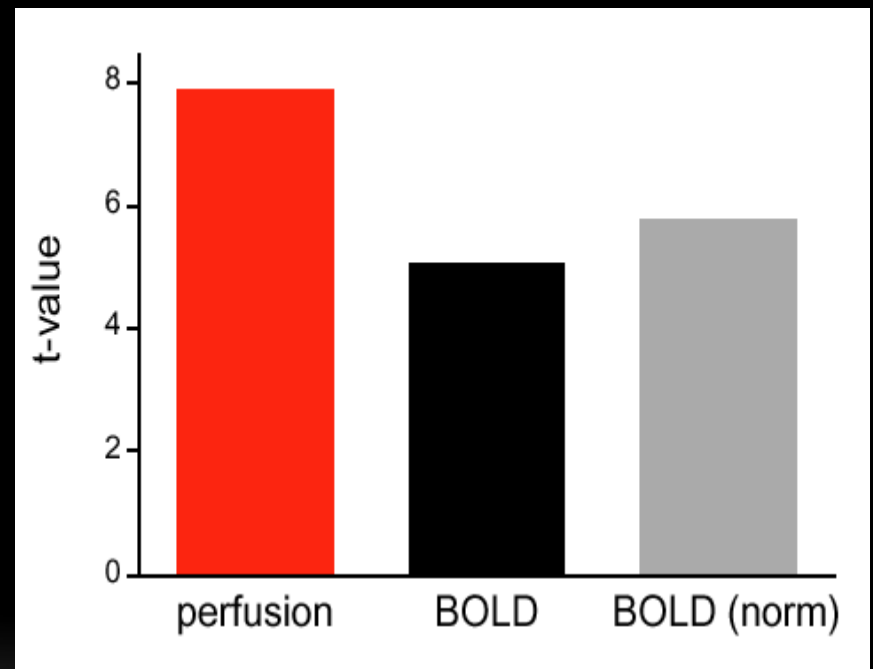

ASL PERFUSION FMRI VS. BOLD (SENSITIVITY)

Aguirre, G., J. Detre, et al. (2002). "Experimental design and the relative sensitivity of BOLD and perfusion fMRI." *Neuroimage* **15**(3): 488-500.

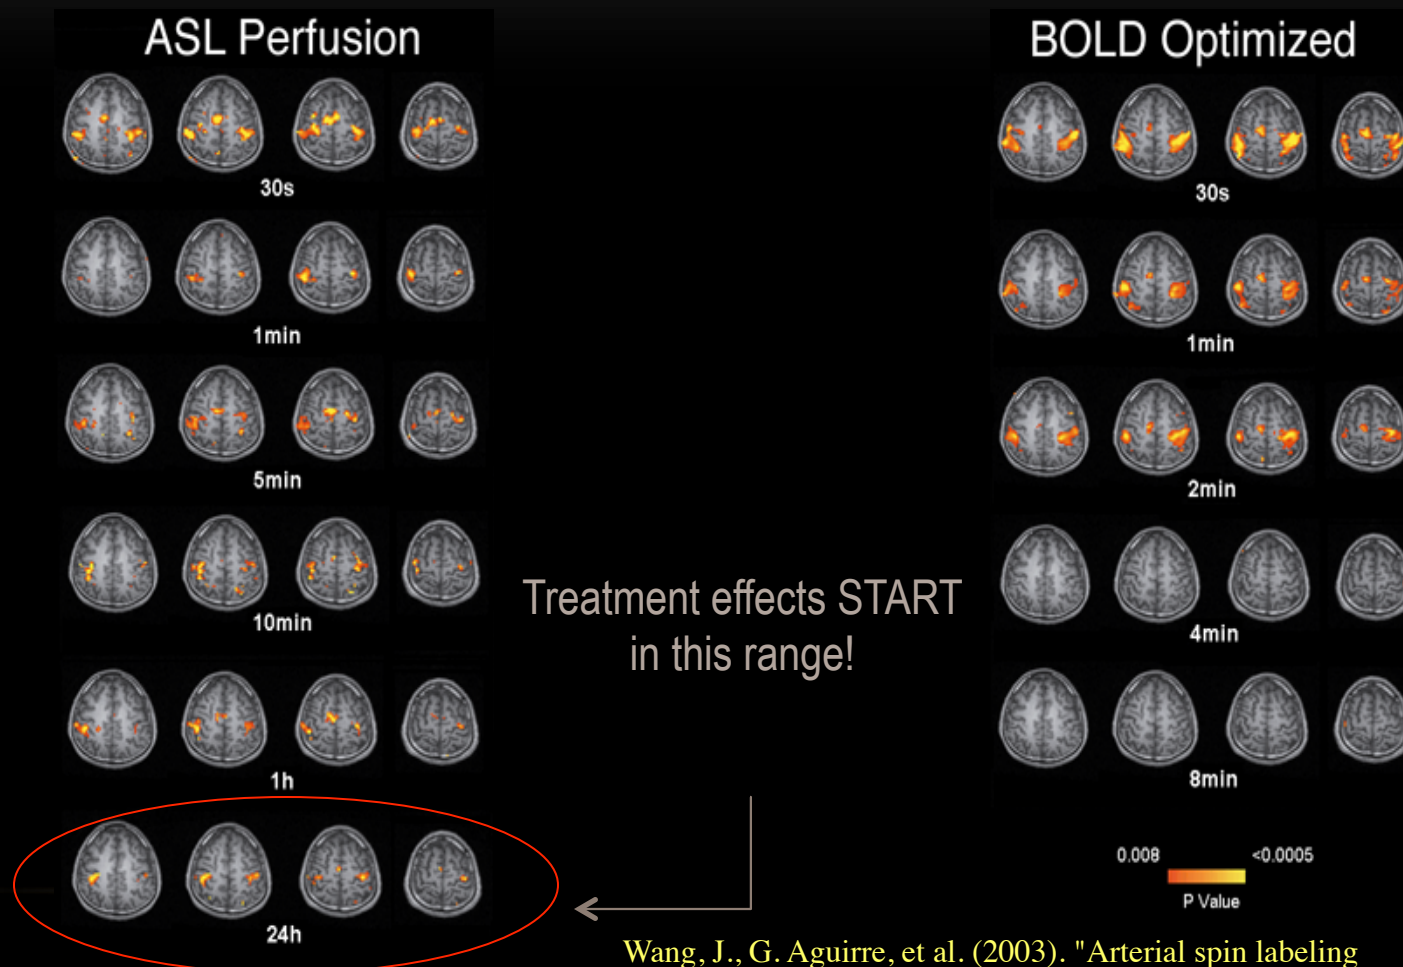

Single Subject

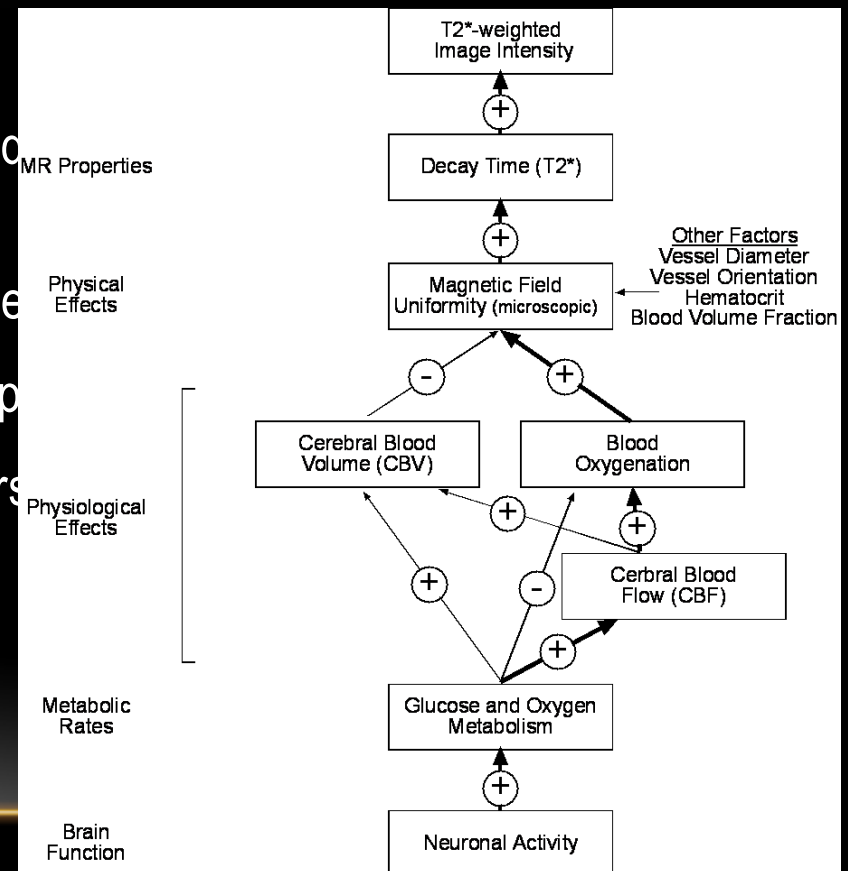

Group Analysis (Random Effects)

ASL PERFUSION VS. BOLD VERY LOW TASK FREQUENCY

WHY ASL? QUANTIFICATION.

- BOLD : a complicated mix of parameters.
- Calibrated (quantitative) BOLD requires additional parameters (not just the BOLD signal itself)
- ASL can yield perfusion directly with simple measurements
- Perfusion is well correlated with local field properties
- Perfusion is fairly stable from person to person
 - Multi-center studies
 - Longitudinal studies ...

WHY ASL?

THE BOLD SIGNAL DRIFT

- Autoregressive structure of MRI noise
- BOLD signals are inherently “drifty” because:
 - Physiological effects
 - Respiration
 - Heart beat
 - Scanner effects
 - Temperature

WHY **NOT** ASL?

- *Current ASL techniques have lower SNR than BOLD!*
 - *(the ASL signal is about 1 % of the total signal in a voxel)*
- *Current ASL techniques are significantly slower than BOLD!*
 - *BOLD can collect one volume every second*
 - *ASL requires a labeling period and a PAIR of images (3 seconds at the very best)*

ASL'S NICHE

- Real time neurofeedback
- Drug Studies
- Attention
- Cognitive Training
- Low frequency paradigms
- Mental State studies
- Population Studies
- ... anything SLOW or requiring Quantification!

SOME ASL STUDIES IN NEUROSCIENCE

- Cognitive neuroscience
 - Attention
 - Working memory
- Clinical applications
 - Schizophrenia
 - Multiple sclerosis
 - Alzheimers

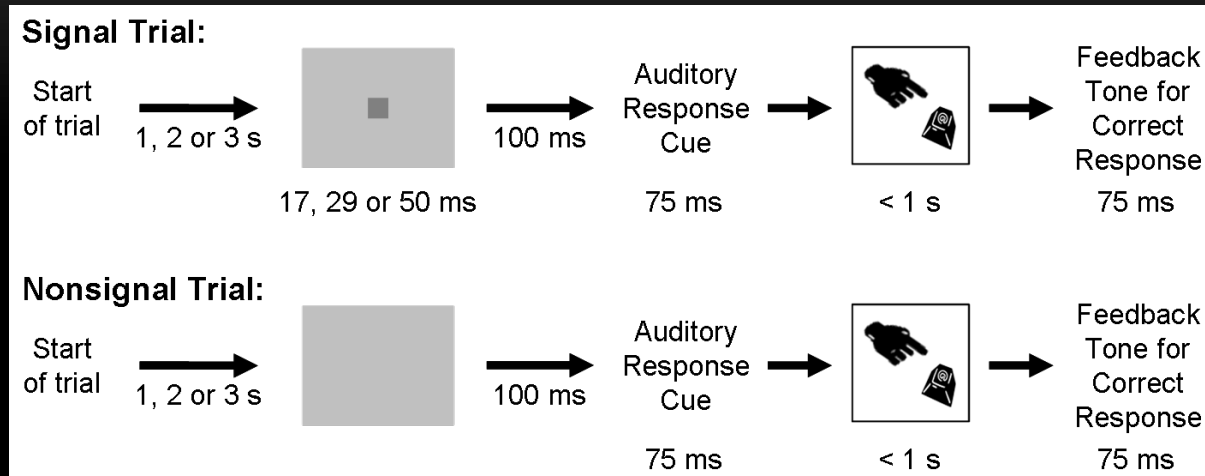

EXAMPLE #1: SUSTAINED ATTENTION STUDY

Demeter, E. et al: “Challenges to attention: a continuous arterial spin labeling (ASL) study of the effects of distraction on sustained attention.”

Neuroimage, vol. 54, no. 2, pp. 1518–1529, 2011.

- What are the neural substrates of sustained attention?
- What does distraction do to your ability to sustain attention?
- How does this relate to existing animal work (measures of cholinergic activity)?

SUSTAINED ATTENTION STUDY: THE EXPERIMENT

- Task paradigm:
 - Long period of time on task: 140 and 160 second blocks
 - Detect the presence of a short visual cue (< 50 ms).
 - Sometimes in the presence of a distracting flashing light.
- Imaging:
 - continuous ASL with separate labeling coil
 - No arterial signal suppression.

SUSTAINED ATTENTION STUDY: FINDINGS

- The distractor impaired behavioral performance.
- Increase in activation in right fronto-parietal regions.
- Recruitment of the mechanisms to maintain attention.
- But ... RDLPFC correlates with worse performance.
- These results mirrored findings in rat studies of cholinergic system.

SUSTAINED ATTENTION STUDY:

- ✓ Slow Paradigm (0.005 Hz)
Intervention
Longitudinal
Baseline activity
Quantification (relative)

EXAMPLE #2: WORKING MEMORY TRAINING STUDY

M. Buschkuhl, et al “Neural effects of short-term training on working memory.”

Cogn. Affect. Behav. Neurosci., pp. 147–160, 2014.

- How does cognitive training affect performance?
- What happens to your brain when you practice?
 - Resting
 - Activation

WORKING MEMORY TRAINING STUDY: THE EXPERIMENT

Visual N-back tasks: 4-back and 1-back
Imaging with pseudo-continuous ASL

1. Test Performance (while collecting ASL images)
2. Train for one week, 20 mins. per day
3. Test Performance (while collecting ASL images)

WORKING MEMORY TRAINING STUDY: FINDINGS

Effect of training:
They get better at it

WORKING MEMORY TRAINING STUDY: FINDINGS

Effect of training:
Resting Perfusion Change

Effect of training:
Activation Perfusion Change

WORKING MEMORY TRAINING STUDY:

- ✓ Intervention
- ✓ Longitudinal
- ✓ Baseline activity
- ✓ Quantification (relative)

EXAMPLE #3: SCHIZOPHRENIA STUDY

Kindler J, et al: “Reduced neuronal activity in language-related regions after transcranial magnetic stimulation therapy for auditory verbal hallucinations.”

Biol Psychiatry. 2013 Mar 15;73(6):518-24.

- Pharmaco-resistant auditory verbal hallucinations (AVH)
- People with AVH show increased activity in areas responsible for speech perception and production.
- What are the effects of repetitive TMS treatment ?

SCHIZOPHRENIA STUDY: THE EXPERIMENT

- Neuronavigation (BOLD imaging of language processing)
- TMS treatment:
 - 10 day course
 - 1-Hz or theta-burst stimulation (TBS)
 - Neuronavigation with frameless stereotaxic system.
- Control group received usual (pharmacological) treatment
- Measure CBF before and after
- Measure psychotic symptom rating scale (psyRATS) before and after

SCHIZOPHRENIA STUDY: FINDINGS

ROI analysis: Reduced CBF in:
primary auditory cortex
Broca's area
cingulate

Clinical: significant reduction in
psyRATS with rTMS

SCHIZOPHRENIA STUDY:

- ✓ Intervention
- ✓ Longitudinal
- ✓ Baseline activity
- ✓ Quantification

EXAMPLE #4 : MULTIPLE SCLEROSIS

D'haeseleer, M et al: "Cerebral hypoperfusion in multiple sclerosis is reversible and mediated by endothelin-1"

Proc Natl Acad Sci U S A. 2013 Apr 2;110(14):5654-8

- We know CBF is reduced in MS
- Chronic hypoperfusion can produce neuronal degeneration similar to MS
- Endothelin-1 (ET1) is a vasoconstrictor
- Inflammatory response in astrocytes : source of ET1.
- Is ET1 responsible for CBF reduction and neuronal damage?
- Therapy?

MULTIPLE SCLEROSIS STUDY: THE EXPERIMENT

Protocol:

1. Measure CBF with pulsed ASL (EPISTAR)
2. Measure ET1 levels in internal Jugular vein
3. Administer ET-1 receptor antagonist : 'bosentan'
4. Measure CBF with pulsed ASL (EPISTAR)
5. Measure ET1 levels in internal Jugular vein

Post-mortem histology in white matter samples from separate cohorts of controls and MS patients (ET-1 tests)

MULTIPLE SCLEROSIS STUDY: FINDINGS

MULTIPLE SCLEROSIS STUDY:

- ✓ Intervention
- ✓ Longitudinal
- ✓ Baseline activity
- ✓ Quantification (relative)

EXAMPLE #5: ALZHEIMER'S DISEASE

Bron, E. E., et al (2014): “ Diagnostic classification of arterial spin labeling and structural MRI in presenile early stage dementia”

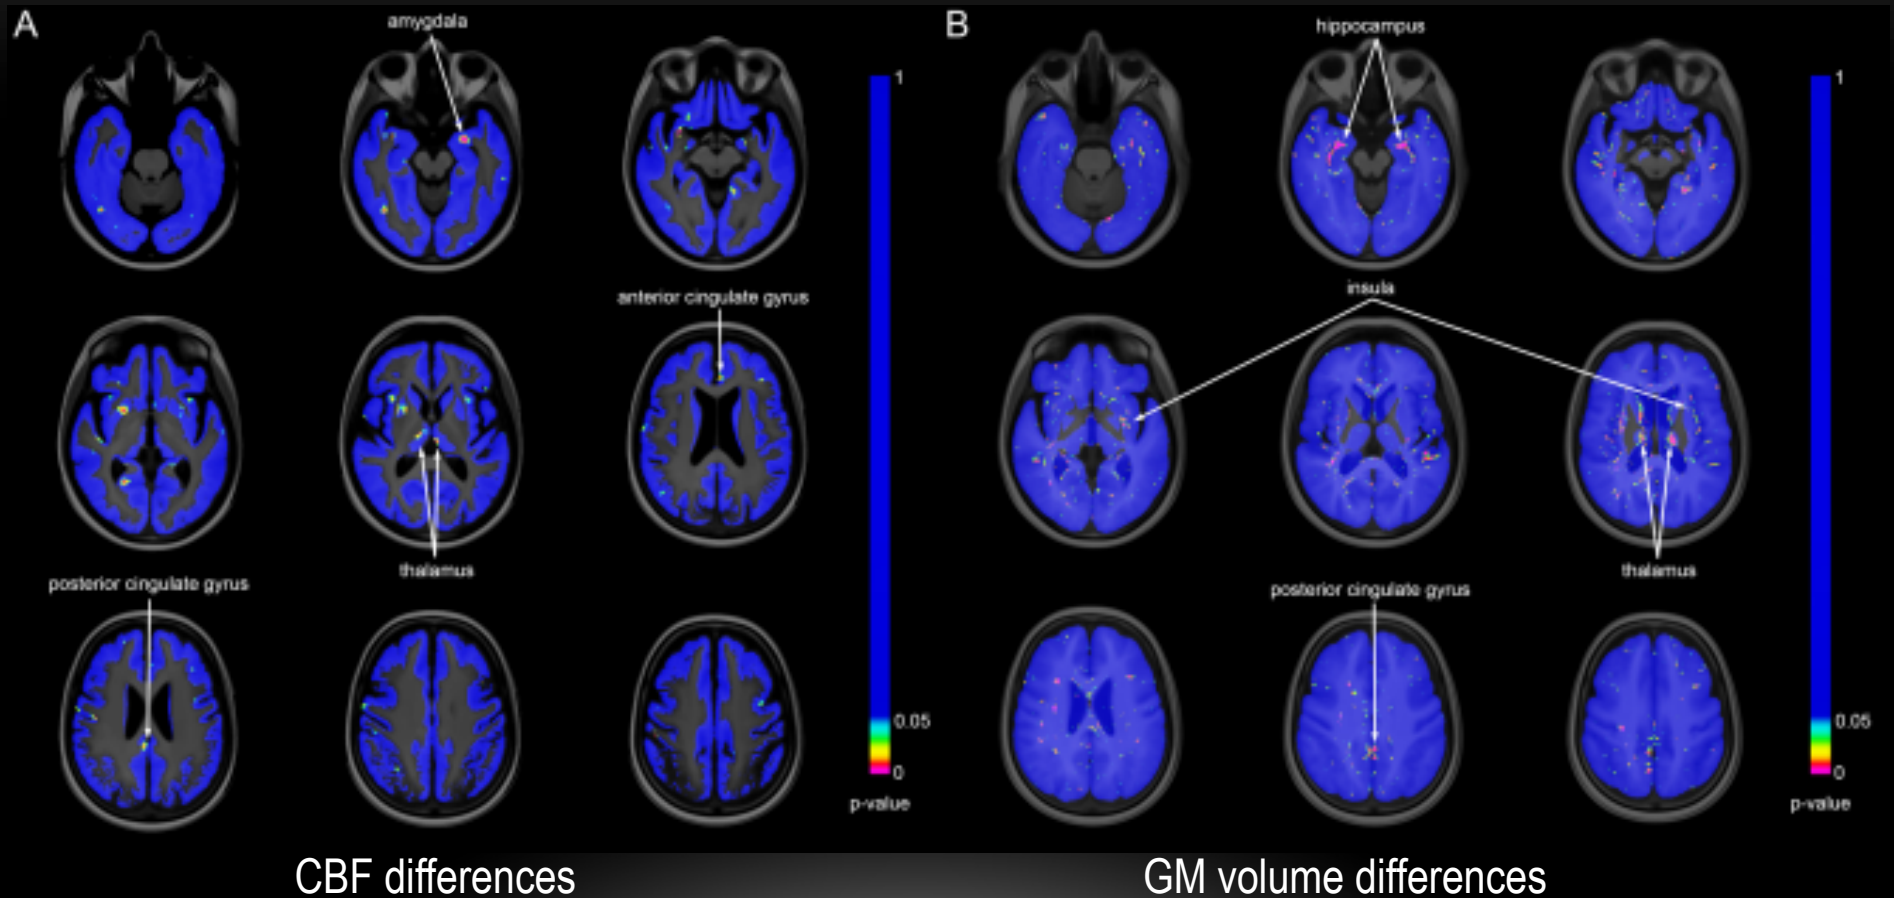

Hum. Brain Mapp.. doi: 10.1002/hbm.22522

- Hypo-perfusion precedes atrophy and dementia
- Find biomarker to predict outcomes: ASL and machine learning.
- ASL data and/or morphometry (GM atrophy) ?

ALZHEIMER'S DISEASE STUDY: THE EXPERIMENT

- Two groups:
 - pre-senile patients with early stage dementia
 - ADNI cohort (elderly AD patients)
- pCASL imaging
- T1 weighted structural imaging
- Can we differentiate patients from controls using...
 - CBF?
 - GM volume?
 - Combination of the two?
- Compare several SVM classification methods

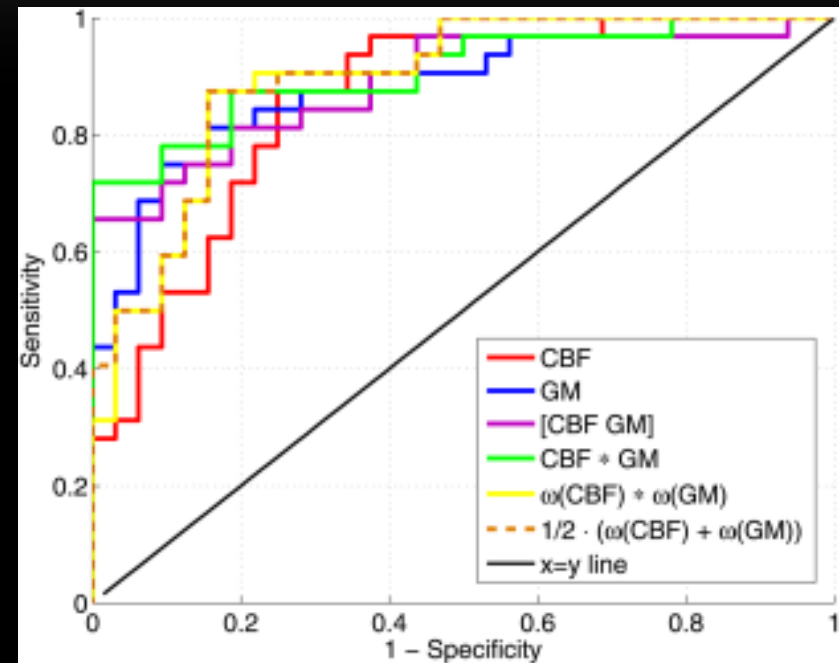

ALZHEIMER'S DISEASE STUDY: FINDINGS

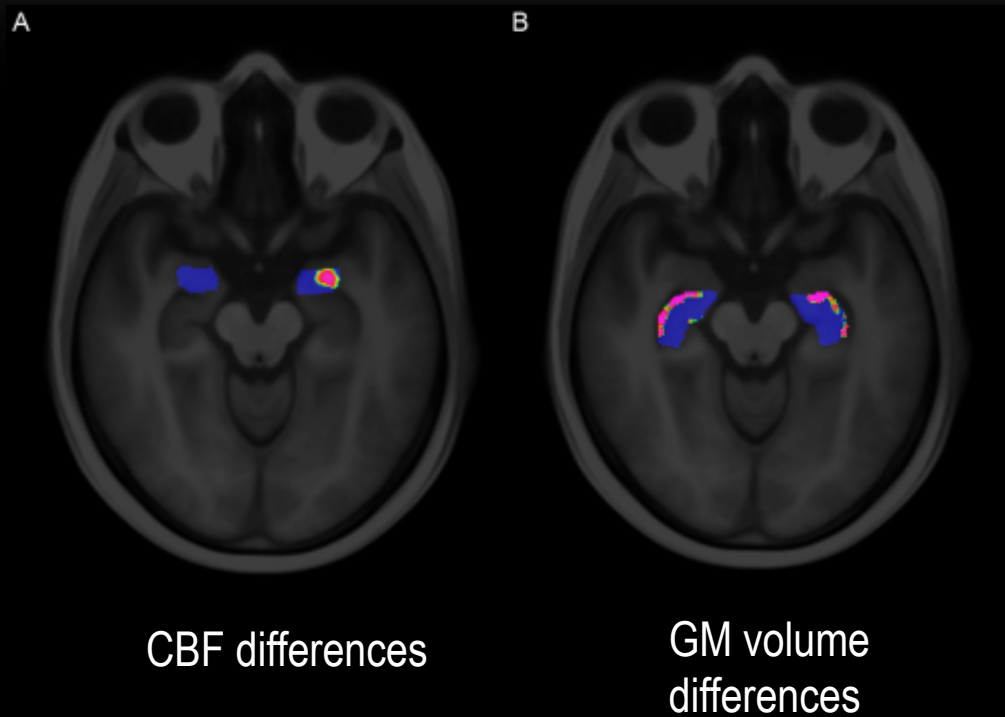

ALZHEIMER'S DISEASE STUDY: FINDINGS

- CBF could be used as a marker for diagnosis by itself
- No real added value in using CBF data *for classification purposes*

Classification ROC

ALZHEIMER'S DISEASE STUDY: FINDINGS

Some interesting observations:

- CBF differences in amygdala
- -GM differences in hippocampus

ALZHEIMER'S DISEASE STUDY:

Intervention

- ✓ Longitudinal
- ✓ Baseline activity
- ✓ Quantification (relative)

RECALL:

- *Current ASL techniques have lower SNR and Speed than BOLD*
- *BOLD breaks down in slow paradigms because of drifts (autoregressive noise)*

- Neurofeedback
- Drug Studies
- Attention
- Cognitive Training
- Slow paradigms
- Mental State studies
- Population Studies
- ... anything SLOW or requiring Quantification!
